ABSTRACT:

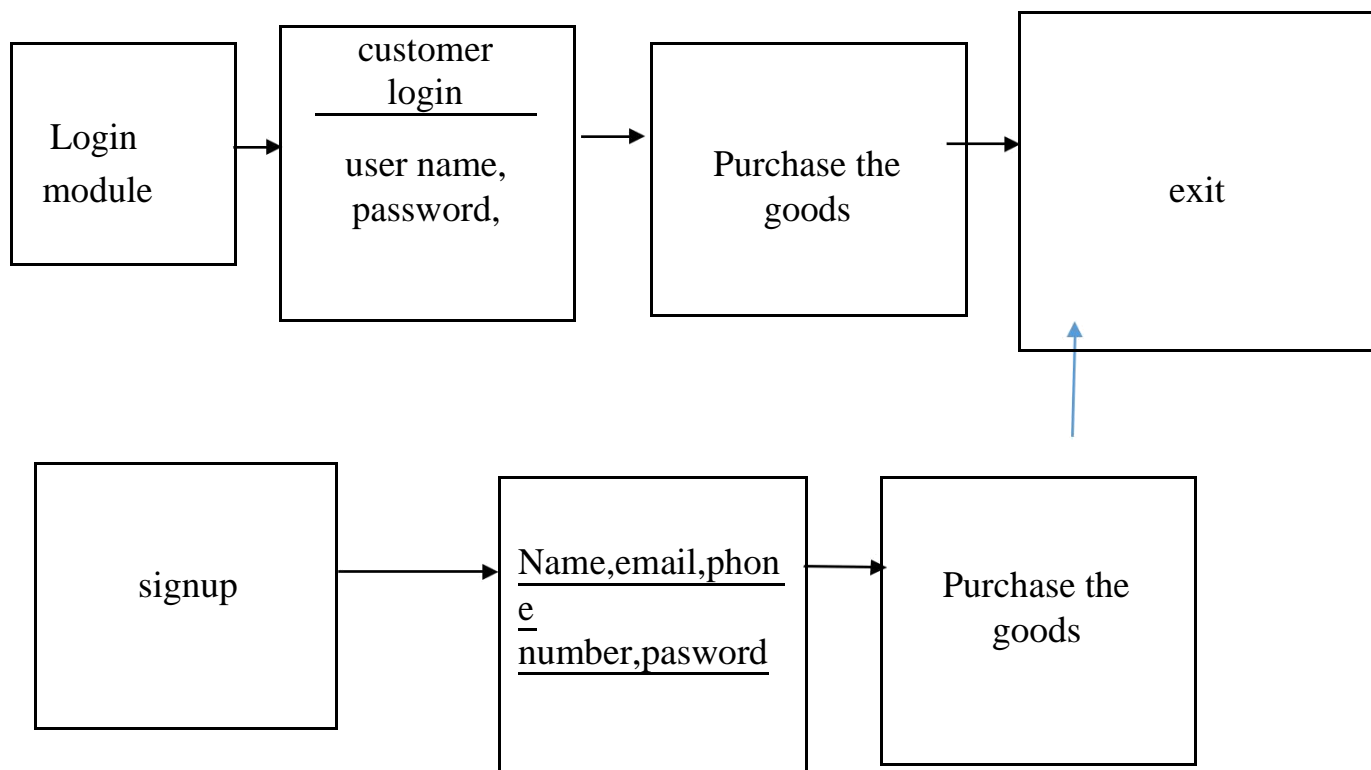

An online super market permits a customer to submit online orders for items and also for service from a store that serves both walk-in customer and online customer The project Supermarket Management System is developed with the objective of making the system reliable, easier, fast, and more informative.

In the manual System, there are number of inefficiencies that a salesperson faces. Large records-books have to be maintained where relevant and irrelevant information has to be stored which is very untidy and clumsy process. The online super market presents an online display of all the items they want to sell This web based application helps customer to choose their daily needs and also add their product to their shopping cart .customer provides their complete details of address and contact and they get their chosen products to their home.

INTRODUCTION:

The Online Supermarket Management System is a project that deals with supermarket automation and it includes both purchasing and selling of items. Online Supermarket system is a web portal where the customer can search for a particular product online. This System is aimed to provide information to the customer about the product and services of the supermarket. In a particular scenario, the customer could have to access the internet. And he can input his/her product details or services according to his/her need. The web interface is provided with some searching criteria and filters that allow the user to complete the search process according to the searching criteria. When the user finishes input, the system will show the result according to the searching criteria. This system has a signup option for new users where they can fill in their details and get a login. If the customer already has a login account, they can directly access the system and buy the products.

ARCHITECTURE DIAGRAM

DATA BASE DESIGN:

```
mysql> desc customer;
```

Field	Type	Null	Key	Default	Extra
username	varchar(30)	YES		NULL	
password	varchar(30)	YES		NULL	
gmail	varchar(30)	YES		NULL	
phno	bigint(10)	YES		NULL	

4 rows in set (0.09 sec)

```
mysql> use mart;
```

Database changed

```
mysql> select * from customer;
```

username	password	gmail	phno
ankith	ankith	ankith@gamil.com	7894455632
vicky	vicky	vishnu@gmail.com	0
karan	ad	karan@23	7530008888

3 rows in set (0.02 sec)
